

1

Let X be a real linear space, p a sublinear functional on X , Y a subspace of X , and f_0 a linear functional on Y such that $f_0 \leq p(x)$ for all $x \in Y$. Then there exists a linear functional f on X such that $f(x) \leq p(x)$ for all $x \in X$ and $f|_Y = f_0$.

- Here for all $x, y \in X$ and $a \geq 0$, $p: X \rightarrow \mathbb{R}$ satisfies

$$p(x + y) \leq p(x) + p(y) \quad \text{and} \quad p(ax) = ap(x).$$

2

Let X be a real linear space and $A, B \subset X$ be nonempty, disjoint, convex subsets. If A is also open, then there exists $f \in X^*$ and $a \in \mathbb{R}$ such that

$$f(x) < a < f(y), \quad x \in A, y \in B.$$

Hint: for $C = z_0 + A - B := \{z_0 + x - y : x \in A, y \in B\}$, define Minkowski functional of C by $p_C(x) = \inf \{\alpha > 0 : \alpha^{-1}x \in C\}$, for all $x \in X$. The result is a sublinear functional on X with $C = \{x : p_C(x) < 1\}$, and that there exists $c > 0$ such that $0 \leq p_C(x) \leq c \|x\|$. You do not have to prove these two facts.

3

Explain that the completeness of X in Theorem 6.5.11 (principle of uniform boundedness) cannot be removed.

Hint: For example, consider $X = \{x = (x_n) \in \ell^2 : x_n \neq 0 \text{ for only finite many } n\}$.

4

Let $T: X \rightarrow Y$ be a bounded linear operator, where X and Y are Banach spaces. If T is bijective, then there are two constants $a, b > 0$ such that $a \|x\| \leq \|Tx\| \leq b \|x\|$, where $\|x\|$ and $\|Tx\|$ stand for the norms on X and Y respectively.

5

Let $X = C[0, 1]$ with sup-norm and Y be the subspace of functions $x \in X$ which have a continuous derivative. Define $T: Y \rightarrow X$ by $Tx = x'$, where the prime denotes differentiation. Then T is closed in the sense that its graph is closed.

6

Suppose that $S = \{s_\alpha : \alpha \in A\}$ is a set of points in X such that $\overline{\text{span}} \{S\} = X$. If $\{f_n\}$ is a bounded sequence in X^* and $\{f_n(s_\alpha)\}$ converges for all $\alpha \in A$, then there exists $f \in X^*$ such that $\lim_{n \rightarrow \infty} f_n(x) = f(x)$ for all $x \in X$.

7

Let X be a finite-dimensional space, then for sequences $\{x_n\} \subset X$ and $\{f_n^*\} \subset X^*$, if there exist $x \in X$ and $f \in X^*$ such that $x_n \rightharpoonup x$ and $f_n^* \xrightarrow{*} f$, then we have $x_n \rightarrow x$ and $f_n^* \rightarrow f$.
